

Overview

In this session we will walk you through an overview of how to extend SAP Commerce Cloud using SAP Cloud Platform, Kyma runtime - a Kubernetes-based open-source platform. You will learn how to use microservices combined with serverless functions and events to create a modern extension scenario for Commerce that will fit your business needs. Furthermore, understand why using this platform is the recommended approach to build extension scenarios and drive innovation for your Intelligent Enterprise.

Requirements

⚠ It is very important that the two steps below are completed before the day of the session, they will enable you to follow the rest of the exercises.

- Get a free trial account on SAP BTP; see this [tutorial](#).
- Enable Kyma runtime on your newly created SAP BTP account; see this [tutorial](#).

Furthermore, while not obligatory, for this session you might also need a local development system. You will have a better experience if you install a code editor such as [VSCode](#).

Other recommended tools we suggest installing:

* **Node.js**

* **Docker and a Docker hub account (Docker ID) in order to push images**
